MEMECOIN + NFT LAUNCH PLAN

The Fee Flywheel: a memecoin that pays its community back

- Token launch — NOXA Fun on Robinhood Chain
- NFT collection — 500 pieces on OpenSea (Robinhood Chain supported)
- Mechanism — creator fees fund weekly buybacks + holder airdrops
- Timing — Robinhood Chain mainnet is weeks old; the window is open now

Prepared July 2026 for @robin_wiener • Version 2.0

Working draft. All figures are adjustable templates, not commitments. Not legal, tax, or financial advice.

15 Appendix — templates & FAQ

1. Executive summary & why now

This project pairs a memecoin on NOXA Fun with a 500-piece NFT collection on OpenSea and connects them with one loop: **trading generates creator fees → fees fund weekly buybacks and NFT-holder airdrops → visible rewards give people a reason to hold and trade → more trading, more fees.** Every claim in the pitch is verifiable on-chain, which is the entire differentiator in a market where 99% of launches are structureless coin-flips.

Why this exact moment

- **Robinhood Chain mainnet launched July 2, 2026** — the ecosystem is nine days old at time of writing, with ~$77M TVL already and a 90-day reduced-gas promotion still running. Early chains reward early natives.
- **The memecoin meta on the chain is already proven:** daily DEX volume passed $30M and the first breakout token (CASHCAT) hit a $60M market cap. Attention is on the chain; supply of quality projects is not.
- **OpenSea added Robinhood Chain support** — NFTs, memecoins and stock tokens trade there now. A same-chain NFT collection was not possible a month ago; the door just opened.
- **NOXA Fun is the chain's primary launchpad** (~$5.2M TVL in its early weeks) and its design does two things competitors don't: every token's LP is permanently locked (rug-resistance by construction), and creators earn a continuous fee stream from their token's V3 pool — the funding source for the whole reward program.

One-line pitch: “A memecoin that pays its community back — every trade funds on-chain buybacks and rewards for the 500 NFT holders who form its inner circle.”

Success targets (day-90)

Metric	Floor	Target	Stretch
Token holders	1,000	5,000	15,000
Avg. weekly DEX volume	$150k	$750k	$3M
NFT mint-out	500/500 in 14 days	500/500 in 48 h	500/500 in 1 h
Consecutive weekly buybacks executed	12/12	12/12	12/12 — this one is binary
NFT floor vs. mint price	≥ 1×	≥ 2×	≥ 5×

2. Market snapshot: Robinhood Chain, July 2026

Signal	Data point	What it means for us
Chain age	Mainnet live July 2, 2026; 90-day gas-fee reduction active	Cheap experimentation window; early-mover branding available
Chain TVL	~$76.7M (July 6)	Real capital arrived in week one
DEX volume	>$30M daily during the memecoin surge	Fee-flywheel math works even with a tiny share of this

Signal	Data point	What it means for us
Breakout proof	CASHCAT memecoin reached ~$60M market cap	The chain can produce winners; narrative attention is here
NFT rails	OpenSea integrated Robinhood Chain (NFTs + memecoins + stock tokens)	Our 500-piece drop rides a brand-new distribution channel
Launchpad	NOXA Fun: ~$5.2M TVL, locked LP, creator fee stream, no bonding curve	Structural safety + a treasury without token taxes
Ecosystem	dYdX (Arcus), Lighter, Rialto, Meridian, Morpho building on-chain	Serious infra = the chain isn't a ghost town after the meta rotates

Competitive read

Launches on young chains cluster into three buckets: (a) pure pump-and-dump tickers with zero structure — the vast majority; (b) “utility” projects that overpromise a product no one wants; (c) community coins with a real retention mechanic — the rare bucket that survives rotation. This project is deliberately built for bucket (c): the retention mechanic is the fee-funded reward stream, and the NFT collection caps the inner circle at 500 so belonging is scarce. The honest comp is what NFT communities did in past cycles — small collections whose holders received ecosystem-token airdrops and treasury yields — compressed into a memecoin-native, fully on-chain format.

Positioning sentence for the deck: “Every launchpad token on this chain has locked liquidity. Only ours has a locked-in community: 500 NFTs, weekly buybacks, and a published fee split you can audit block by block.”

3. The pitch

3.1 Narrative arc

Memecoins are attention assets: the pitch must work as a 15-second scroll-stopper first and survive a 15-minute diligence read second. The arc: **Hook** (the character + one-liner) → **Grievance** (every coin you've held extracted from you) → **Mechanism** (the flywheel — fees flow back, visibly) → **Proof** (locked LP, public wallet, published split) → **Scarcity** (500 seats) → **Momentum** (chain is 9 days old, we're first movers) → **Call to action** (buy / earn allowlist points).

3.2 Three one-liner options (A/B test in bio + pinned post)

- “The memecoin that buys itself back.”
- “Every trade pays the community. 500 seats. All on-chain.”
- “Locked liquidity. Weekly buybacks. 500 NFTs that get paid. That's it, that's the coin.”

3.3 Pitch deck — slide-by-slide (10 slides)

#	Slide	Content
1	Cover	Mascot art full-bleed + one-liner. Nothing else.
2	The grievance	One chart: typical memecoin holder P&L; decay. “Where did the value go? Out.”
3	The fix	Flywheel diagram (section 4). One sentence: fees come back, visibly.
4	Why now	The four market bullets from section 1 — chain age, volume, OpenSea, NOXA.

#	Slide	Content
5	Token	Launch mechanics: NOXA deploy, LP locked forever, no taxes, 1% pool fee.
6	Buyback policy	The published split + weekly cadence + public wallet address (QR).
7	The 500	NFT collection: art preview grid, utility table, rarity tiers.
8	Airdrop math	What one Common / one Legendary earns at three volume scenarios.
9	Roadmap	12-week plan, three phases, dated.
10	Join	How to earn allowlist points today + links. QR to Telegram/X.

3.4 Launch thread — ready-to-edit copy (X)

```
1/ Every memecoin you've ever held had one exit: yours.
We built one where value flows the other way.
Introducing $[TICKER] — the memecoin that buys itself back. ■

2/ Launched on @Noxa_Fi on Robinhood Chain. That means: LP locked forever at deploy — nobody can pull
it. No token taxes. Just a 1% pool fee on every trade.

3/ Here's the part nobody else does: the creator fees from that pool don't go to our pockets. Every
Friday, 18:00 CET, they're claimed and split — 40% buybacks, 30% to NFT holders, 30% ops. Published
policy. Public wallet.

4/ Buybacks are executed from one labeled wallet and every tx hash gets posted. Don't trust us — watch
the chain.

5/ The inner circle: 500 NFTs on @opensea (yes, Robinhood Chain is live there now). Holders get the
launch airdrop + a weekly slice of fees. Forever. Rarity = bigger slice.

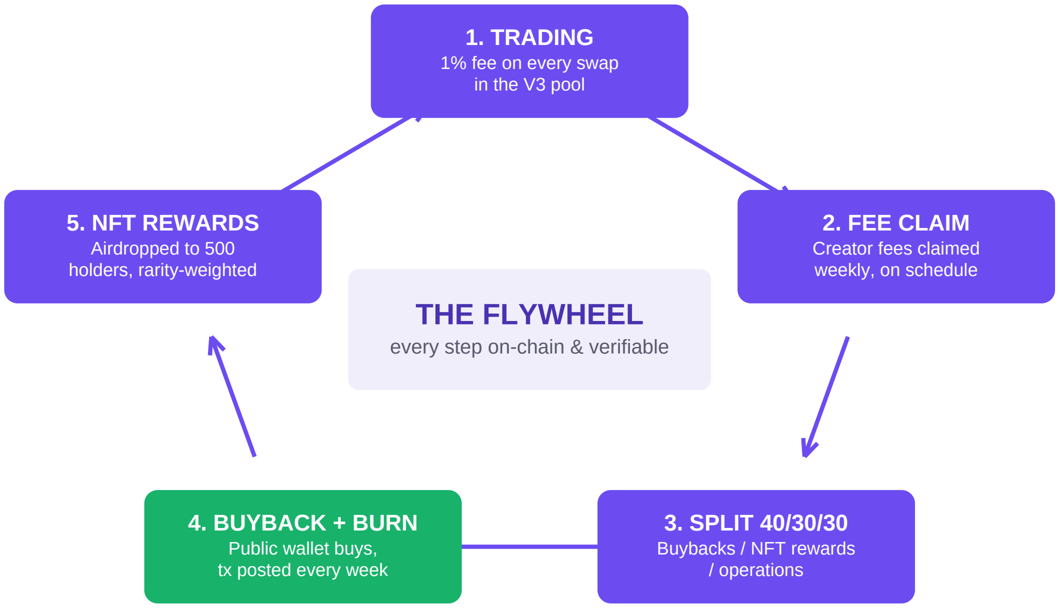
6/ No promises of price. No “utility soon.” One mechanism, running weekly, verifiable by anyone with a
block explorer.

7/ Allowlist opens now. Points for holding, memes, and raids — details pinned in TG. 500 seats. That's
the whole supply. Ever.

8/ $[TICKER]. The flywheel starts Friday. [links]
```

Keep tweet 6 — the anti-promise — verbatim if possible. Refusing to promise price action is both the compliance-safe move and, at this point in the cycle, the more credible flex.

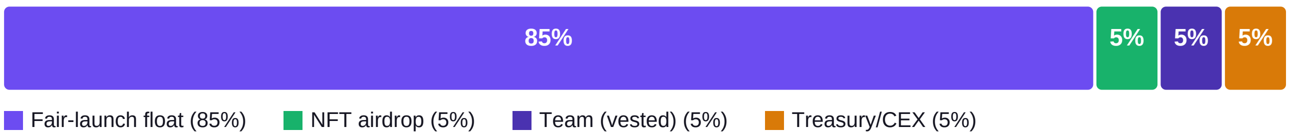
4. The flywheel



The flywheel is the product. Each arrow is a public, scheduled, on-chain event — which converts the usual memecoin trust problem ("will the dev rug?") into a weekly, checkable ritual. Two design rules keep it credible: **(1) promise formulas, never amounts** — "40% of creator fees" is always true, "$4,000/week" breaks the first slow week; **(2) never skip a week** — a $50 buyback executed on schedule is worth more than a $5,000 one executed randomly, because the asset being built is predictability.

5. Tokenomics, treasury & the Buyback Policy

5.1 Supply allocation (template: 1,000,000,000 tokens)



NOXA launches are effectively fair launches — the pool holds the float from block one and the team buys its own position transparently at/after deploy. The 5% NFT-airdrop tranche and 5% team tranche are bought/set aside early and moved to labeled wallets immediately, then governed by the vesting rules below. Publish all wallet labels before launch.

Tranche	Size	Rules (publish these)
Fair-launch float	85%+	In the locked V3 pool from deploy; no privileged pre-allocation
NFT holder airdrop	5% (50M)	Locked wallet; distributed per section 7 schedule; any unclaimed after 6 months → burned
Team	5%	6-month linear vest, 1-month cliff; wallet labeled TEAM-VEST; selling outside schedule = reputational suicide, so schedule it publicly
Treasury / listings	5%	Labeled wallet; only for exchange listings, LP incentives, or community votes; every movement announced first

5.2 Fee-flow scenarios (weekly)

Assumes the coin captures a small fraction of current chain volume. Creator share of the 1% pool fee must be verified against NOXA's live docs before publishing — the table assumes ~50% reaches the creator; rescale if not.

Scenario	Daily volume	Weekly fees (1%)	Creator share (~50%)	Buybacks 40%	NFT rewards 30%	Ops 30%
Bear	$25k	$1,750	$875	$350	$262	$262
Base	$150k	$10,500	$5,250	$2,100	$1,575	$1,575
Bull	$750k	$52,500	$26,250	$10,500	$7,875	$7,875
CASHCAT-tier	$3M	$210,000	$105,000	$42,000	$31,500	$31,500

5.3 The Buyback & Rewards Policy v1.0 (publish this verbatim)

1. Creator fees accrued by the $[TICKER] V3 pool are claimed every Friday at 18:00 CET.
2. Claimed fees are split in the same transaction batch: 40% to the Buyback Wallet, 30% to the Rewards Wallet, 30% to the Operations Wallet. All three addresses are published and labeled.
3. The Buyback Wallet market-buys $[TICKER] within 24 hours of each claim. Purchased tokens are sent to the burn address. Tx hashes are posted within 1 hour of execution.
4. The Rewards Wallet distributes its balance to NFT holders per the published rarity weights, within 72 hours of each claim, based on a snapshot taken at an undisclosed block during the prior week.
5. Distributions are discretionary community rewards funded by realized fees. They are not interest, dividends, or a promise of profit, and may be zero in any week where fees are zero.
6. Any change to this policy will be announced 14 days in advance and put to an NFT-holder vote.

Clause 5 is doing compliance work (see section 14) — keep language like this everywhere rewards are described.

6. The 500-piece NFT collection

6.1 Concept

Working name: **"The Inner 500."** One mascot (the coin's character), 500 variants, hard-capped forever. The collection is not decoration — it is the membership register for the reward stream. That single sentence should appear on the OpenSea collection page, the site, and the deck.

6.2 Rarity tiers — the exact 500

Tier	Count	% of supply	Reward weight	Total weight units	How they're made
Legendary	5	1%	4×	20	Hand-finished 1/1s — unique full-art, no shared traits
Epic	25	5%	2.5×	62.5	Rarest trait combos, forced by the generator
Rare	90	18%	1.5×	135	At least one low-weight trait guaranteed
Common	380	76%	1×	380	Standard weighted-random assembly
Total	**500**	100%	—	**597.5**	Weight units drive both airdrops & weekly rewards

6.3 Trait architecture (~50 assets to produce)

Layer (bottom→top)	Variants	Weighting example	Ideas
Background	8	4 common (18% ea) / 3 uncommon (8%) / 1 rare (4%)	gradients, chart-up, chain motif, vault door
Base character	6	3 standard / 2 uncommon / 1 gold (2%)	color variants of ONE mascot, same pose
Outfit	10	6 / 3 / 1 distribution as above	hoodie, suit, astronaut, robe, hi-vis, tux
Eyes	8	5 / 2 / 1	normal, laser, hearts, dead, star
Headwear	10	incl. 25% "none"	crown, halo, beanie, propeller, chef
Accessory	8	incl. 30% "none"	diamond hands, flag, coin, sword, briefcase

Combination space: 8×6×10×8×10×8 = **245,760** — sampling 495 (5 are 1/1s) guarantees uniqueness with room for a series 2. Publish the full trait table with weights at reveal; rarity transparency is table stakes.

6.4 Mint pricing & revenue scenarios

Price for **mint-out, not revenue** — a sold-out 500 at a modest price beats 300/500 at a premium, because the reward stream (not the mint) is where holder value lives, and "SOLD OUT" is itself marketing. 25 NFTs reserved for team/marketing at 0 cost; 475 sold.

Mint price	Gross (475)	Via OpenSea Studio (–10%)	Own contract (–gas)	Read
$15	$7,125	$6,412	~$7,100	Easy mint-out, low treasury
$25	$11,875	$10,687	~$11,800	Balanced — recommended starting point
$40	$19,000	$17,100	~$18,900	Needs strong allowlist demand signal first

Decide the price AFTER watching allowlist signups: >1,500 point-earning wallets supports $40; <600 means price at $15 and lean on the reward story.

6.5 Allowlist points system (run for ~3 weeks pre-mint)

Action	Points	Cap	Why it's weighted this way
Hold ≥ $50 of $[TICKER] at random weekly snapshot	30 /week	90	Rewards actual holders, not tourists
Hold ≥ $500 at snapshot	+60 /week	180	Whale retention
Original meme that the team reposts	40	120	Content engine — quality-gated, not spam-gated
Raid/quote-post campaign participation	10	50	Reach, but capped so bots can't farm it
Invite that results in a point-earning wallet	15	75	Sybil-resistant referrals (invitee must earn, not just join)
Top-50 leaderboard bonus	50	50	Competition dynamics in week 3

Top 300 wallets by points → allowlist (guaranteed window, e.g. 2 mints each). Next 200 → waitlist. Export exact addresses — OpenSea allowlists reject ENS names and typos.

7. Airdrop design — exact math

7.1 Launch airdrop (the 5% tranche = 50,000,000 tokens)

Distributed across 597.5 weight units (section 6.2) = **83,682 tokens per weight unit**:

Tier	Weight	Tokens per NFT	× count	Tier total	Share of tranche
Legendary	4×	334,728	5	1,673,640	3.3%
Epic	2.5×	209,205	25	5,230,125	10.5%
Rare	1.5×	125,523	90	11,297,070	22.6%
Common	1×	83,682	380	31,799,160	63.6%

7.2 Vesting & claim schedule

Event	When	Amount	Mechanism
Snapshot #0	Mint-out block (announced after the fact)	—	Registry of 500 holder addresses frozen
Tranche 1	Within 72 h of mint-out	25%	Batched multisend to snapshot addresses
Tranches 2–4	Day 30 / 60 / 90, each on a fresh snapshot	25% each	Re-snapshot each time → rewards go to CURRENT holders, supporting secondary demand
Unclaimed/edge cases	Day 180	remainder	Burned, publicly

7.3 Weekly reward drops (the 30% fee share)

Using the Base scenario from 5.2 ($1,575/week to the Rewards Wallet), one weight unit ≈ $2.64/week. Illustrative holder outcomes — **never publish these as promises, only as "what last week actually paid," after the fact:**

Holder	Weekly (Base)	Weekly (Bull)	90-day cumulative (Base)
1 Common NFT	~$2.64	~$13.18	~$34
1 Rare	~$3.95	~$19.77	~$51
1 Epic	~$6.59	~$32.95	~$86
1 Legendary	~$10.54	~$52.72	~$137

Snapshot procedure for weekly drops: pick a random block within the prior week, reveal it only when distributing. This makes snapshot-sniping (buy Thursday, sell Saturday) unprofitable and quietly rewards continuous holders.

8. Production pipeline — 500 unique NFTs with AI traits

You produce ~50 trait images, not 500 finals. The generator does the rest. Budget: $30–150 of image-model credits, 1–2 weeks of iteration, $0 of tooling (open source). The bottleneck is taste and QA, not tech.

Step	What	Tools	Output / gate
1. Lock the mascot	One character, one fixed pose, front-facing, plain background. Iterate until it IS the brand. Save the exact prompt + reference image = the “style formula.”	Midjourney / Higgsfield / GPT-image	1 master PNG + prompt doc
2. Generate traits	Re-render the SAME character per trait, changing ONE clause of the prompt at a time, same canvas (2048×2048). Batch per layer.	same + reference-image conditioning	~50 raw renders
3. Cut to layers	Background-removal on every trait; align all on identical canvas; every layer must composite with every other.	rembg / Photoshop	~50 transparent PNGs
4. Collision QA	Composite 30 random stacks; fix clipping (hat×eyes, accessory×outfit). Maintain an exclusion list in the config.	generator preview mode	0 visual collisions
5. Generate 495	Weighted random assembly, uniqueness check, forced Epic combos, rarity targets from 6.2–6.3.	HashLips engine or ~80-line Python/PIL script	495 PNGs + rarity report
6. The five 1/1s	Hand-finished Legendaries — full-art, no shared layers.	manual + AI	5 PNGs
7. Metadata	One ERC-721 JSON per token: name, description, image URI, attributes[]. Script-emitted, schema-validated.	generator script	500 JSONs
8. Pin to IPFS	Upload images folder → get CID → inject into JSONs → upload metadata folder → final baseURI. Never a private server.	Pinata (free tier fits)	2 CIDs, tested in gateway
9. Dry run	Deploy to testnet, mint 3, check rendering on OpenSea testnet, metadata, reveal flow, royalties.	testnet + OpenSea	all green → go

Sample metadata (token #17)

```
{
  "name": "The Inner 500 #17",
  "description": "One of 500. Holders receive weekly community rewards under the published Buyback & Rewards Policy
  "image": "ipfs://<IMAGES_CID>/17.png",
  "attributes": [
    {"trait_type": "Tier",       "value": "Rare"},
    {"trait_type": "Background", "value": "Chart Up"},
    {"trait_type": "Base",       "value": "Classic"},
    {"trait_type": "Outfit",     "value": "Astronaut"},
    {"trait_type": "Eyes",       "value": "Laser"},
    {"trait_type": "Headwear",   "value": "Crown"},
    {"trait_type": "Accessory",  "value": "None"}
  ]
}
```

I can build the entire generator (weighted assembly, exclusion rules, uniqueness check, rarity report, metadata emission, IPFS-ready folders) as soon as trait art exists — it's an afternoon of work in this workspace.

9. OpenSea launch — decision tree & runbook

9.1 Contract path decision

	Path A — OpenSea Studio Drop	Path B — own ERC-721 contract
What	Studio deploys a SeaDrop ERC-721; stages, price, schedule and drop page configured in UI. No code.	Deploy audited template (e.g. thirdweb Drop) directly on Robinhood Chain; run mint from your own page; OpenSea indexes it for secondary automatically.
Cost	No upfront fee; OpenSea takes 10% of primary mint revenue	Gas only (~negligible on RH Chain); keep 100% of mint
Chain	Only if Studio's deploy-chain list includes Robinhood Chain that week — verify first; else Studio means launching on Base instead	Any EVM chain including Robinhood Chain, today
Choose when	Speed + drop-page distribution matter more than 10% and chain unity	Same-chain-as-coin is non-negotiable (recommended default)

Recommendation: Path B on Robinhood Chain unless Studio supports the chain by mint week. Chain unity (coin + NFT + rewards in one wallet, one explorer) is worth more to this pitch than OpenSea's drop-calendar placement.

9.2 Launch runbook

T-	Action
T-14 d	Contract on testnet; 3-NFT dry run; metadata + reveal + royalty (5%) verified on OpenSea testnet view
T-10 d	Reveal trait table + rarity tiers publicly; open pricing decision window (watch allowlist count, §6.4)
T-7 d	Mainnet deploy; verify contract on explorer; OpenSea collection page claimed & branded (banner, PFP, one-paragraph flywheel description, links)
T-5 d	Freeze allowlist (top 300 + 200 waitlist); publish exact mint schedule & per-wallet caps (3)
T-2 d	Publish mint tutorial (wallet setup on RH Chain, funding, gas). Assume 30% of minters are new to the chain
T-0	Stage 1: allowlist window (24 h, guaranteed 2). Stage 2: waitlist+public (cap 3). Team mints its 25 LAST, publicly
T+1 d	If not minted out: keep public open, shift marketing to reward-stream math; do NOT cut price (repricing nukes trust)
T+3 d	Reveal. Rarity Bot / trait rankings live. First “rarity flex” content wave
T+7 d	Snapshot #0 announced retroactively; launch airdrop tranche 1 distributed; transparency page updated — the flywheel's first full public cycle completes

10. Marketing & community playbook

10.1 Channel roles

Channel	Role	Cadence
X (@robin_wiener + project account)	Narrative, proof-posts, memes, threads	2–4 posts/day during launch phases
Telegram	Community home, allowlist points bot, announcements	always-on; daily prompts
OpenSea collection page	Conversion surface for NFT buyers	updated at reveal + weekly floor/reward stats
Transparency page (simple site or Notion)	Every claim/split/buyback/airdrop tx, cumulative totals	every Friday, same hour

Channel	Role	Cadence
DEX screeners (Dexscreener etc.)	Where degens actually discover the coin	keep socials/logo/description filled from day 1

10.2 The weekly ritual (the retention engine)

Friday 18:00 CET, every week, no exceptions: claim → split → buyback → post the four tx hashes as a thread with running totals ("Buyback #7: $2,100. Cumulative: $14,350 bought & burned. Rewards to 500 holders: $1,575."). This thread IS the marketing. Screenshots of reward payouts land in holders' feeds every week — 500 walking billboards. Add a monthly "State of the Flywheel" with charts.

10.3 Content engine

- **Meme kit:** release the mascot as transparent PNGs + template formats in week 1 — make the community's production cost zero. Best meme each week wins allowlist points (pre-mint) or tokens (post-mint, from ops budget).
- **Proof-posts > hype-posts:** the recurring formats are buyback receipts, reward receipts, burn tally, holder count. Numbers, hashes, screenshots.
- **KOLs:** micro-KOLs (5–50k followers) in the RH Chain / NOXA niche only, paid in tokens from ops with disclosed deals. Avoid mega-KOL paid shills — expensive, low-trust, compliance-ugly.
- **Collabs:** allowlist swaps with 2–3 other early RH Chain communities; joint memes with NOXA's own account (tag them in every launch milestone — young platforms amplify their winners).
- **Crisis rule:** if something breaks (missed buyback, bug, exploit rumor) — post first, fully, fast. The transparency brand only survives if it holds on bad days.

11. 12-week roadmap

Wk	Phase	Milestones	Success gate
1–2	Foundation	Mascot + name locked; style formula saved; X/TG live; meme kit v1; transparency page skeleton; wallets created & labeled; policy v1.0 drafted	You can show the character and the policy to a stranger and they get it in 60 s
3	Coin launch	Deploy on NOXA Fun; policy published BEFORE deploy; seed team buy; Dexscreener profile filled; launch thread posted	First buyback executed & posted within 7 days of deploy — even if tiny
3–5	Prove the ritual	3 consecutive Friday cycles; weekly proof-threads; allowlist points system opens; meme contest #1	≥1,000 holders; 3/3 buybacks on time
4–7	NFT production (parallel)	Trait art generated & cut; generator built; 495 + 5 assembled; QA passed; IPFS pinned; testnet dry run green; rarity table published	0 collisions; 500/500 render correctly on testnet OpenSea
6–7	Pre-mint heat	Allowlist freeze (300+200); pricing decision per §6.4; mint tutorial out; art teasers daily; collab allowlist swaps	≥600 point-earning wallets (else price low & extend a week)
8	Mint	Runbook §9.2 executes; reveal T+3; tranche-1 airdrop T+7	Mint-out ≤ 14 days (floor target: 48 h)
9–12	Flywheel era	Weekly cycles uninterrupted; monthly State of the Flywheel; first holder vote (burn vs vault); series-2 teaser at week 12 if floor ≥ 2× mint	12/12 buybacks; NFT floor ≥ mint; volume retention >40% from week-8 peak

12. KPI dashboard (track weekly, publish monthly)

KPI	Source	Healthy	Warning	Act
Weekly DEX volume	Dexscreener	flat or up	−30% w/w	content push, collab, CEX-listing talk
Holder count	explorer	growing	net negative 2 wks	re-examine reward visibility; holder-only perk
Buyback streak	own records	unbroken	—	never break it; automate the calendar
NFT floor / mint ratio	OpenSea	≥1×	<0.7×	shift narrative to weekly yield receipts; holder vote event
NFT unique holders	explorer	>350 of 500	<250 (whale concentration)	per-wallet caps on future drops; whale outreach
TG DAU / members	TG stats	>15%	<5%	daily prompts, points for participation
Reward $ per weight unit	own records	published weekly	falling 4 wks straight	volume initiatives; NEVER top up from team funds silently — announce if you do

13. Risk matrix

Risk	L	I	Mitigation
Volume dies after launch meta rotates	High	High	All promises are %-of-fees (small week = small drop, not broken promise); NFT scarcity story is volume-independent; series-2 & collabs re-ignite
Regulatory reclassification (token or NFT = security / MiCA breach)	Med	High	Policy clause 5 language everywhere; no profit promises; legal review of ALL public copy pre-launch; geo-block US persons from mint page if counsel advises
Mint doesn't sell out	Med	Med	Price for demand (§6.4); never reprice down; keep public mint open & pivot marketing to yield receipts; unminted supply burn-able by holder vote as last resort
Snapshot / distribution bug pays wrong wallets	Low	High	Dry run every distribution on testnet fork; publish snapshot data before sending; small tranche first
Team key compromise (buyback/reward wallets)	Low	High	Multisig (2-of-3) on all three wallets from day 1; hardware keys
Copycat launches with same pitch	High	Low	First-mover + execution streak is the moat; copycats without 12 unbroken weeks of receipts strengthen your comp
NOXA/RH Chain platform failure or rule change	Low–Med	High	LP lock is on-chain regardless; keep ops treasury on a major chain; document a migration/continuity plan for rewards
Team burnout / missed Friday	Med	Med	Automate claim+split scripts; write the runbook so any of 2+ people can execute; pre-schedule holiday weeks publicly

14. Compliance notes — MiCA / Netherlands

You operate from the Netherlands, so EU rules apply to what you publish. This section is orientation, not legal advice — budget for 2–3 hours with a crypto-literate lawyer before the policy and pitch go public.

- **MiCA marketing rules:** crypto-asset marketing communications must be fair, clear, not misleading, and identifiable as marketing. The practical translation: no promised returns, no “passive income,” no APY framing; describe rewards as discretionary distributions funded by realized fees (Policy clause 5 wording).

- **Token classification:** a pure memecoin with no rights attached is generally the safe zone. The reward stream to NFT holders is where classification risk concentrates — because “money flows from the efforts of a team to asset holders” resembles a security/asset-referencing arrangement. Mitigations: discretionary language, no fixed rates, rewards tied to a published community policy rather than a contractual right, and lawyer-reviewed copy.
- **The NFTs:** MiCA largely excludes unique NFTs, but regulators look through form to substance — 500 fungible-ish “yield positions” could be reclassified. The rarity/art uniqueness and the discretionary nature of rewards are your substantive arguments; don't undermine them with “earn passive income” marketing.
- **Tax (NL):** creator fees and mint revenue are likely taxable income for you (box 1 if this is an active business); holdings may hit box 3. Airdrops may create taxable events for holders. Keep the transparency page as your bookkeeping spine and get an accountant who has seen crypto before.
- **Consumer law basics:** publish terms for the mint (what buyers get, what they don't, refund position), and keep every promotional claim consistent with the policy doc — divergence between hype copy and legal copy is what gets projects in trouble.

15. Appendix — templates & FAQ

15.1 Weekly proof-post template

```
FLYWHEEL WEEK #[N] — receipts ■
Claimed: $[X] in fees (tx: [hash])
→ Buyback: $[0.4X] bought & burned (tx: [hash])  |  Cumulative burned: [total]
→ Rewards: $[0.3X] to 500 NFT holders (tx: [hash])  |  per Common this week: $[y]
→ Ops: $[0.3X]
Same time next Friday. Chain doesn't lie: [transparency page link]
```

15.2 Transparency page structure

Header: the three labeled wallet addresses + policy v1.0 full text. Table, one row per week: date, fees claimed (tx), buyback amount + hash, tokens burned, rewards distributed + hash, ops amount, cumulative totals. A second table: every airdrop tranche. That's the whole page — boring on purpose; boring is the brand.

15.3 FAQ (pin in Telegram)

Q	A
Is the liquidity locked?	Yes — permanently, by NOXA's locker at deploy. It cannot be pulled. Verify: [locker link]
What do NFT holders actually get?	The launch airdrop (5% of supply, vested) plus a weekly share of 30% of creator fees, weighted by rarity — as discretionary community rewards under the published policy
Is this financial advice / guaranteed income?	No. Rewards depend entirely on trading fees and can be zero. Nothing here is investment advice
Why only 500 NFTs?	The reward pool divides among holders — scarcity IS the utility. 500 is forever; no stealth series-2 dilution (any future series votes first)
When do buybacks happen?	Every Friday 18:00 CET. Every hash gets posted. Streak so far: [N]
What happens to bought-back tokens?	Burned (dead address). Holders can vote to switch to a community vault — that vote is on the roadmap

Q	A
Can the team dump?	Team tranche is 5%, 1-month cliff + 6-month linear vest, labeled wallet, movements announced in advance
Which wallet/chain do I need?	Robinhood Chain (EVM) — setup tutorial: [link]. NFTs are visible on OpenSea

Offer stands: next deliverables I can build in this workspace — the pitch deck itself (10 slides, from §3.3), the NFT generator + metadata pipeline, mascot concept art, or the transparency page HTML.
